Math 1A Worksheet #20

Name _____

1. A street light is mounted 20 feet above a ground at the top of a pole. A 5 foot-tall teenager runs towards the pole at a rate of 7 feet per second. At what rate is the length of her shadow shrinking while she is 28 feet from the pole? (your answer should be negative)

$$\frac{dx}{dt} = -\frac{7}{3} \text{ ft/s}$$

2. A red car is positioned 50 kilometers due east of a blue car. Suddenly, both cars start moving: the red car moves at a constant rate of 20 km/h east, while the blue car moves at a constant rate of 30 km/h north. At what rate is the distance between the two cars increasing 3 hours after the two cars start moving?

$D = \sqrt{(x+50)^2 + y^2}$

$\frac{dD}{dt} = \frac{1}{2\sqrt{\dots}} (2(x+50)\frac{dx}{dt} + 2y\frac{dy}{dt})$

$\frac{dD}{dt} = \frac{1}{2\sqrt{\dots}}$

at 3 hours, $x = 60$
 $y = 90$

$\frac{dD}{dt} = \frac{1}{2\sqrt{110^2 + 90^2}} (2(110)(20) + 2(90)(30)) \quad 1 \text{ km/hr}$

3. A fluid is being pumped into an inverted conical tank at a constant rate of 10,000 cm³/min. Suppose that the tank has height 8 m and the diameter of the top is 6 m. What is the rate at which the water level is rising when the height of the water is 4 m?

4. Estimate the following quantities using linear approximation via a tangent line. A hint is provided for the first part.

(a) $e^{-0.1}$ (use the tangent line to $y = e^x$ at $(x, y) = (0, 1)$)

(b) $\sin(3.24)$ (recall that $\pi \approx 3.14$).

(c) $\sqrt{9.001}$

(d) 1.999^3

A.) $y' = e^x$, $y'(0) = 1$, \sim tangent $y = x + 1$; $e^{-0.1} \approx 0.9$
 B.) $y = \sin(x)$; $y'(\pi) = \cos(\pi) = -1 \sim$ tangent $y = -x + \pi$ $\sin(3.24) \approx 0.1$
 C.) $y = \sqrt{x}$; $y'(x) = \frac{1}{2\sqrt{x}}$; $y'(9) = \frac{1}{6}$; tangent $y = \frac{1}{6}(x-9) + 3$; $\sqrt{9.001} \approx 3 + \frac{1}{6000}$
 d.) $y = x^3$; $y'(x) = 3x^2$; $y'(2) = 12$; tangent ~~$y = 2(x-2) + 4$~~ ; $1.999^3 \approx 8 - 0.012$
 $y = 12(x-2) + 8$

5. Let u, v be functions of x . Recall that the differential dx is defined as an independent variable, and the differential du is defined by the equation $du = u'(x)dx$. So du depends on x and dx . Prove the following identities.

(a) $d(u+v) = du + dv$ Sum Rule
 (b) $d(uv) = v du + u dv$ Product Rule
 (c) $d\left(\frac{u}{v}\right) = \frac{v du - u dv}{v^2}$ Quotient Rule.
